

Innspill til GMO Extranet: EFSA/GMO/BE/2012/110 – Mais MON 87427

A, 3.2.1
Experimental
design

The Norwegian GMO panel would like to know if the glyphosate treated maize MON87427 used as the treated control in this application, has been subjected to relevant (“real life”) agricultural practices with respect to glyphosate application rate and dose.

A, 4. Toxicological assessment	The applicant has performed acute toxicity testing separately for the CP4 EPSPS protein. This test was however not performed according to the OECD guideline 401. The exposure doses were only up to 572 mg/kg which does not fulfill the OECD guideline 401 limit test application (2000 mg/kg bw).
